EXECUTIVE INSIGHT REPORT TEMPLATE
ApnoAI Final Project — Data Analytics Track

==========

Title: ApnoMart Q2 2026 — Strategic Insights
Analyst: Saloni Maindalkar
Date: 27/10/2026
Tool Used: [Power BI / Looker Studio / Excel / etc.]

INSIGHT 1: Revenue Pattern

Sales total ₹16.26M and no category dominates: Furniture leads at ₹3.52M (21.6%) and Electronics trails at ₹2.96M (18.2%), a gap of only 3.4 points. The monthly trend is the real story. Sales zig-zag between ₹2.47M and ₹2.96M: July peaks at ₹2.96M (220 orders), while June (₹2.54M, 182 orders), August (₹2.65M) and October (₹2.47M, 185 orders) dip. The swings come from order volume, not order value, since the average order value stays between ₹12.7K and ₹13.9K. By weekday, Sunday is the weakest at 12.0% of sales against 16.1% on Wednesday.

So What: ApnoMart's demand is steady by product but uneven by month. June and October order counts sit about 16–17% below July. Lifting those two months to the six-month average of 200 orders would add about 33 orders, worth roughly ₹4.5L over six months (about ₹2.2L per quarter, estimate).

Dashboard reference: Total Sales by Category and Total Sales by Month.

INSIGHT 2: Profitability Pattern

Total profit is ₹4.42M at a 27.18% margin. Profit by region is steady at ₹0.80M–₹0.94M and follows each region's sales (margins 26.7%–27.7%), so region is not where profit leaks. The leak is Electronics: 18.2% of sales but

only 12.6% of profit (₹0.56M), a margin of 18.9% against 34.8% for Office Supplies. All five Electronics products sit between 17.9% (Monitor) and 19.5% (Laptop), and every region between 17.6% and 19.6%. Discounts are not the main cause: across all 1,200 orders, discount and margin are almost uncorrelated (−0.02).

So What: Electronics earns ₹0.19 of profit per ₹1 of sales, against ₹0.35 for Office Supplies. Cutting discounts will not fix this because the weak margin shows at every discount level, so the lever is product cost and pricing. Each extra margin point on Electronics is worth about ₹0.15L per quarter.

Dashboard reference: Total Profit by Region (flat across regions) and Total Sales by Category (Electronics lowest).

INSIGHT 3: Customer Behavior Pattern

Corporate is the largest segment at 26.5% of sales (₹4.31M) and has the highest average order value (₹14,042), about 7.5% above Home Office (₹13,067). The four segments are close, all between 23.1% and 26.5%. Cash is still the top payment method at 22.0% of sales (₹3.57M), ahead of UPI at 20.6% (₹3.35M). UPI has the highest average order value (₹14,429) but also the heaviest average discount (13.8%) and the lowest margin (26.1% against 27.8% for Cash). Small Business takes 24% of its sales in Cash and 16% via UPI, while Home Office takes 24% via UPI.

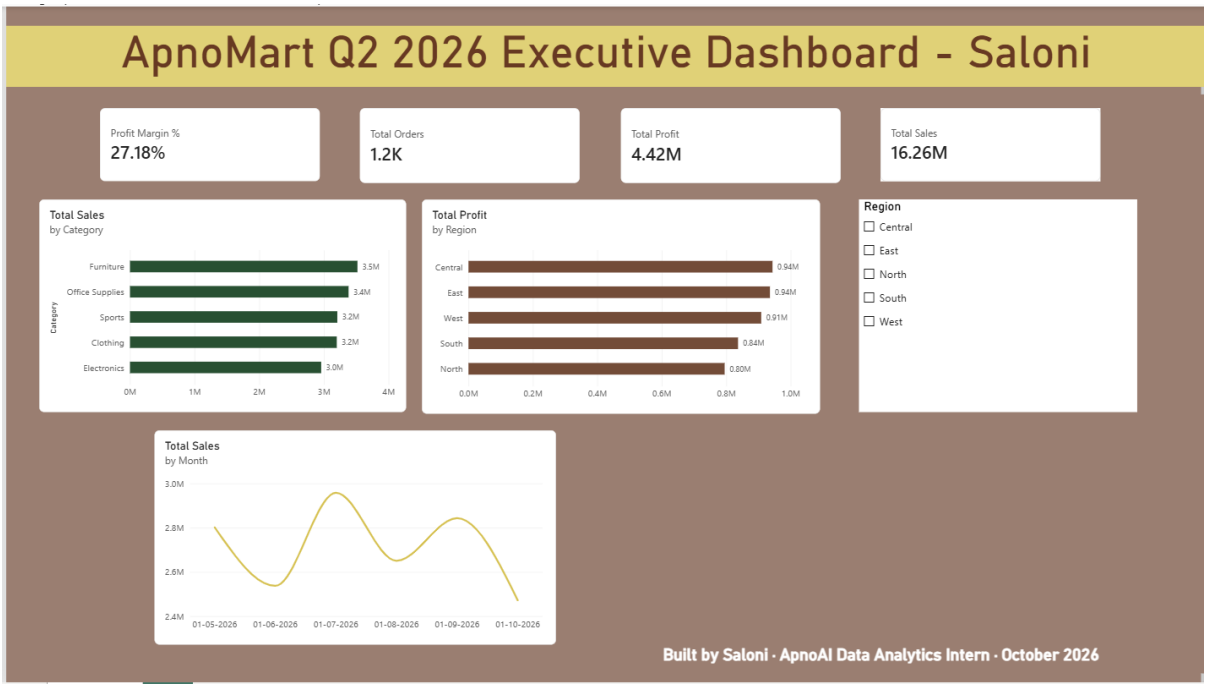

So What: No segment is clearly underserved, so offers should target payment habits instead of segment size. UPI orders are large but cost more in discounts, so a test cap on UPI discounts could protect margin. Corporate is the account group to retain.

STRATEGIC RECOMMENDATION

Next quarter, the CEO should launch an Electronics margin-recovery program: renegotiate supplier cost and reprice the five Electronics products to lift margin from 18.9% to about 24%, and cap Electronics discounts at 15%. Electronics is the only category well below the 27% company average, and the gap is the same across every product and region.

Projected impact: about +₹0.7L profit per quarter (5 points on roughly ₹14.8L of quarterly Electronics sales), with little revenue risk because discounts barely move volume in this data.
